

Main goal of the defense is to compose a webpage for two different device configurations

Three web page variants are given. The one that you get you will have to slice into individual parts and compose two layouts of the webpage for different devices. One will have to be for a mobile phone in a portrait mode (you should select an appropriate template from the “Create New” templates (figure 1)). The second will be for a tablet in a landscape position (figure 2).

You can use any crop or slice tools that you want to use and know from the lab works.

You do not have to use all of the cutout elements, some of them may simply have no room in your composition.

Grading will be based on the cut quality of the individual elements and the composed layouts.

Upload these files to Moodle:

- The PSD of the sliced elements;
- The PSD of phone composition;
- The PSD of the tablet composition;
- The JPG of the phone composition;
- The JPG of the tablet composition;
